

Provisional Patent Disclosure Draft

Working Title

Systems and Methods for Guided Song-Section Productization, Selection, Commerce, and Fulfillment

Inventor / Applicant Notes

Inventor: Gregory Putnam / G Putnam Music

Project: K-KUT

Date: 2026-05-25

Abstract

A computer-implemented system provides guided selection, productization, commerce, and fulfillment of exact song sections. A source audio work is presented to a user as a full-song reference, after which the system identifies selectable song sections and contiguous section combinations. A guided assistant, referred to as MC-BOT, recommends occasion-appropriate KKs/KUTs while preserving a complete governed menu of valid options. Each visible choice has a selectable state, but audio playback and checkout are gated until the exact selected section audio has been generated, reviewed, and approved. The system supports source-backed public rendering, audio verification, payment handoff, and fulfillment gating.

Background

Users selecting music for personal occasions often need a specific emotional moment rather than an entire song. Existing systems typically offer full tracks, static previews, general playlists, or conventional greeting cards. They do not provide a governed user flow in which a person hears a source song, receives guided recommendations for exact song-section products, selects from solo sections or contiguous combinations, and purchases or sends an approved section-specific audio product.

Summary of the Invention

The invention includes systems and methods for:

1. Presenting a full source song or source audio work to establish user context.
2. Mapping the source work into selectable song-section units.
3. Recommending one or more section units based on occasion, intent, or recipient context.
4. Displaying a complete governed menu of solo sections and contiguous section combinations.

5. Capturing user selection of a section unit.
6. Distinguishing between selectable, playable, buyable, and fulfilled states.
7. Preventing checkout or fulfillment until exact approved section audio exists.
8. Rendering public product pages from source-backed assets without hard dependency on backend catalog availability.
9. Auditing page, link, audio, and payment throughput as a release gate.

Definitions

PIX

A source audio work, track, or source-backed asset used as the initial full-song reference.

KK / KUT

A defined song-section product candidate, such as a solo section or contiguous combination of song sections. A KUT may become playable, buyable, and fulfilled after approval.

KK-Kombo

A contiguous combination of multiple song sections.

MC-BOT

A guided recommendation layer that maps user occasion or intent to recommended song-section choices.

Twinkle / Page Presentation

The user-facing presentation layer for a KUT, including visible labeling, ordering, helper copy, audio controls, selection controls, and approval status.

Detailed Description

Full-song-first flow

The system first presents the user with the full source song. This allows the user to understand the emotional context before choosing a particular section.

Guided recommendation

After the full source reference is available, MC-BOT recommends one or more KKS. The recommendation may be based on occasion type, relationship, recipient, emotional tone, or other user intent.

Governed menu

The system displays a governed menu of valid options. In one embodiment, the menu includes:

- recommended Ks first;
- all solo sections;
- all contiguous K-Kombos;
- no non-contiguous stitching unless separately approved.

Selection state

Each visible user choice has an active selection link or equivalent interaction. Selection may be stored in URL parameters, session state, database state, or other application state.

Playable state

A selected KUT becomes playable only when the exact section audio has been materialized and verified.

Buyable state

A KUT becomes buyable only when the exact audio, page presentation, fulfillment metadata, and checkout path are approved.

Fulfilled state

A KUT becomes fulfilled when it is delivered to a buyer or recipient through a link, page, SMS, email, downloadable file, or other delivery channel.

Source-backed public rendering

The public page may render from controlled source-backed rows first. Backend systems such as Supabase or other catalogs may enrich the page but are not required for basic customer page availability.

Audit gate

A BIC audit checks that:

- public pages return 200;
- visible links resolve;
- visible audio sources return valid audio responses;
- visible choices have selection links;

- checkout handoffs redirect correctly;
- no public page depends on unavailable backend tables.

Wedding Embodiment

In one embodiment, the Wedding path uses a source track titled Forever & A Day.

The user flow includes:

1. Full song first.
2. MC-BOT Wedding Path.
3. Recommended first KK: V2 + Ch2.
4. Recommended second KK: V2-End.
5. All solo sections:
 - Intro
 - Verse 1
 - Chorus 1
 - Verse 2
 - Chorus 2
 - Bridge
 - Final Chorus
 - Outro
6. All contiguous combos:
 - Intro + Verse 1
 - Verse 1 + Chorus 1
 - Verse 2 + Chorus 2
 - Verse 2 + Chorus 2 + Bridge
 - Bridge + Final Chorus
 - Final Chorus + Outro
 - V2-End
7. Checkout locked until exact approved KUT audio exists.

Operational Gates

The system maintains separate states:

- Selectable: user can choose it.
- Playable: exact audio exists and plays.
- Buyable: checkout and fulfillment are approved.
- Fulfilled: item has been delivered.

Claims Support Notes

Potential claim areas include:

1. A method of presenting a source audio work and generating governed song-section product choices.
2. A method of guided occasion-based recommendation of exact song sections.
3. A method of controlling commerce availability based on approval state of exact section audio.
4. A system for source-backed public rendering independent of backend catalog uptime.
5. A method of auditing public page, link, audio, selection, and checkout throughput.
6. A method of presenting recommended section combinations while preserving a complete governed menu.
